Does this help us? If you have questions, let me know and I can write back ...

Also, can you upload this info with screenshots as needed (PNG) to the issue?

Thanks!
L

Hello Elizabeth,

I hope that this email finds you well. Thank you for sending in your question.

There are a couple of different ways that you can export search results through Web of Science that will let you export more than 50 results at a time.

Exporting a Marked List:

1. When you are clicked into your marked list, click on the "Export" button and select the format that you would like your information exported in

2. Select "Records From" and give the range that you wish to download and select the information that you want included in the download. Once you are finished, click "Export" and the file will export and automatically download on your computer.

Some export formats (such as plain text file) allow you to include the full record and cited references in your download. You can export between 500-1000 records at a time, depending on which format you choose. For RIS, Endnote, and some others, you can download up to 1000 records at a time. If you choose to include the cited references, as in the plaint text file example below, you can export up to 500 records at a time.

You can also do this same process from the "Search results" screen of a saved search, rather than making a marked list first. It simply depends on your preference.

I hope that this helps and answered your question. Please don't hesitate to let us know if anything is unclear or if you have any further questions.

Helen Brown, the librarian for the Faculty of Forestry, may be able to help you with more detailed questions if I have not quite captured what you are looking for here. Helen is out of the office and will be returning on July 22nd, but she will be able to answer messages once she has returned. If you would like to send her a message, her email address is: helen.l.brown@ubc.ca.

Kind regards,

Rachael

I am wondering if you'd be able to help me with exporting references for making a citation network using Web of Science.

So far we've used the combine search query to get two lists of journal articles:
- papers citing either Janzen 1970 OR Janzen 1971 that are about predator satiation
- papers citing either Janzen 1970 OR Janzen 1971 that are about density dependence

We would like to determine the degree of crosstalk among these papers, but to make our citation network we also need to download every reference that shows up in these lists. For example, the papers on predator satiation number 202, and we also want the list of all of the references that are included in these papers. I tried using the marked list but it restricts me to 50 papers at a time which is feasible but tedious, and I'd be downloading a list of around 2000 papers each time.

Is there a way we could do this all at once, or if there's a way you could help us with this? Thanks for your help!

Hi Lizzie,

I'll give these solutions a try (that one about saving it as EndNote or whatnot seems much better than 50 at a time)...and also, uploaded! As both .png and .pdf in case.

Best regards,
Justin
